Appendix A

TABLE A.4

Areas of the standard normal distribution. The entries in this table are the probabilities that a standard normal random variable is between 0 and z (the shaded area).

SECOND DECIMAL PLACE IN Z

Assume 1000 people took the SAT,

- ► What are the scores on the test that corresponds to 3, 2, 1, 0, -1, -2, -3 standard deviations?
- Assume 1000 people took the SAT,
 - If Jon got a 700 on the math section, how many people scored above him?

- ► What are the scores on the test that corresponds to 3, 2, 1, 0, -1, -2, -3 standard deviations?
- Assume 1000 people took the SAT,
 - If Jon got a 700 on the math section, how many people scored above him?

If 300 people scored below Anna on the verbal section, what was Anna's score?

- ► What are the scores on the test that corresponds to 3, 2, 1, 0, -1, -2, -3 standard deviations?
- Assume 1000 people took the SAT,
 - If Jon got a 700 on the math section, how many people scored above him?

- If 300 people scored below Anna on the verbal section, what was Anna's score?
- How many people got scores between 390 and 610?

- ► What are the scores on the test that corresponds to 3, 2, 1, 0, -1, -2, -3 standard deviations?
- Assume 1000 people took the SAT,
 - If Jon got a 700 on the math section, how many people scored above him?
 - If 300 people scored below Anna on the verbal section, what was Anna's score?
 - How many people got scores between 390 and 610?
 - If Sigga got a 350 on the math section, how many people scored below her?

- What are the scores on the test that corresponds to 3, 2, 1, 0, -1, -2, -3 standard deviations?
- Assume 1000 people took the SAT,
 - If Jon got a 700 on the math section, how many people scored above him?
 - If 300 people scored below Anna on the verbal section, what was Anna's score?
 - How many people got scores between 390 and 610?
 - If Sigga got a 350 on the math section, how many people scored below her?
 - If Einar was in the 98% percentile in math, what was Einar's score?

▶ T scores have a mean of 50 and a standard deviation of 10.

► T scores have a mean of 50 and a standard deviation of 10.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

What would T scores of 30 and 70 be as z-scores?

T scores have a mean of 50 and a standard deviation of 10.

- What would T scores of 30 and 70 be as z-scores?
- stanine, range from 1 to 9, are centered at 5 with a standard deviation of 2. Each stanine, corresponds to 1/2 a standard deviation and the 5th stanine is at the mean.

- **T** scores have a mean of 50 and a standard deviation of 10.
 - What would T scores of 30 and 70 be as z-scores?
- stanine, range from 1 to 9, are centered at 5 with a standard deviation of 2. Each stanine, corresponds to 1/2 a standard deviation and the 5th stanine is at the mean.
 - If you were in the 3rd stanine, what would your z-score be?

- **T** scores have a mean of 50 and a standard deviation of 10.
 - What would T scores of 30 and 70 be as z-scores?
- stanine, range from 1 to 9, are centered at 5 with a standard deviation of 2. Each stanine, corresponds to 1/2 a standard deviation and the 5th stanine is at the mean.
 - If you were in the 3rd stanine, what would your z-score be?
 - How many people would be below you assuming 1000 people took the same test as you?

- **T** scores have a mean of 50 and a standard deviation of 10.
 - What would T scores of 30 and 70 be as z-scores?
- stanine, range from 1 to 9, are centered at 5 with a standard deviation of 2. Each stanine, corresponds to 1/2 a standard deviation and the 5th stanine is at the mean.
 - If you were in the 3rd stanine, what would your z-score be?
 - How many people would be below you assuming 1000 people took the same test as you?
 - What percent of the people are between the 3rd and the 6th stanines?

- **T** scores have a mean of 50 and a standard deviation of 10.
 - What would T scores of 30 and 70 be as z-scores?
- stanine, range from 1 to 9, are centered at 5 with a standard deviation of 2. Each stanine, corresponds to 1/2 a standard deviation and the 5th stanine is at the mean.
 - If you were in the 3rd stanine, what would your z-score be?
 - How many people would be below you assuming 1000 people took the same test as you?
 - What percent of the people are between the 3rd and the 6th stanines?

 Various linear and non-linear transformations are done to create scores and scores may be normalized. How do you interpret confidence intervals?

- How do you interpret confidence intervals?
- How do you construct confidence intervals?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- How do you interpret confidence intervals?
- How do you construct confidence intervals?

 $\underline{X} \pm \underline{M} * \underline{SE}$ Estimate Multipler Standard Error

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- How do you interpret confidence intervals?
- How do you construct confidence intervals?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Are we talking about the population or the sample?

- How do you interpret confidence intervals?
- How do you construct confidence intervals?

- Are we talking about the population or the sample?
- How does this relate to a hypothesis test?

What is a correlation?

- Is it an association?
- Does it imply causation?
- Is a correlation necessary for causation?
- Does it need linearity?
- Is it affected by variability?
- Is it affected by outliers?
- Is it related to the simple linear regression?

What is the Pearson correlation coefficient?

Pearson correlation coefficient

$$\frac{\sum (X-\bar{X})(Y-\bar{Y})}{\sqrt{\sum (X-\bar{X})^2 \sum ((Y-\bar{Y})^2}}$$

Calculating Pearson correlation coefficient

	Х	Υ
	5	6
	3	0
	1	0
Mean	3	2

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

x <- c(5, 3, 1) y <- c(6, 0, 0) cor(x, y)

Always look at the residuals

Brief history of testing

- 2200 BCE, Chinese believed to use testing for determining who would get governmental jobs
- Greek and Romans categorized individuals based on personality type ("blood" or "phlegm")
- Francis Galton's classification based on "natural gift" (i.e. eugenics)
 - Contributed to development of questionnaries, rating scales, and self-report inventories

- Wilhelm Wundt's laboratory and his focus on "standardization"
 - James Cattell's mental tests
 - Charles Spearman reliability and factor analysis

- 1905, Binet and Simon publish a test measuring intelligence in mental retarded school children in Paris
- 1939, Wechsler publishes a test to measure intelligence in adults (would become WAIS)
- Group intelligence test administered by the US military during WWI and WWII

Behavior on tests predicts non-test behavior

- Psychological traits and states exist
- Psychological traits and states can be measured

- Behavior on tests predicts non-test behavior
- Measurement error is part of the process

- Psychological traits and states exist
- Psychological traits and states can be measured

- Behavior on tests predicts non-test behavior
- Measurement error is part of the process
- Test can be fair

- Psychological traits and states exist
- Psychological traits and states can be measured

- Behavior on tests predicts non-test behavior
- Measurement error is part of the process
- Test can be fair
- Test can benefit society

What makes a good test?

Individuals scores are relative only to some reference group

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- Individuals scores are relative only to some reference group
- This group should represent the entire pool of test takers for the tested construct

- Individuals scores are relative only to some reference group
- This group should represent the entire pool of test takers for the tested construct
- Collectively, this group is known as a normative sample and data from them make up the norms

- Individuals scores are relative only to some reference group
- This group should represent the entire pool of test takers for the tested construct
- Collectively, this group is known as a normative sample and data from them make up the norms
- Standardization is the process of setting clear procedures for administrating, scoring, and interpreting the test

- Individuals scores are relative only to some reference group
- This group should represent the entire pool of test takers for the tested construct
- Collectively, this group is known as a normative sample and data from them make up the norms
- Standardization is the process of setting clear procedures for administrating, scoring, and interpreting the test
- The normative sample could also be the standardized sample but not always

- Individuals scores are relative only to some reference group
- This group should represent the entire pool of test takers for the tested construct
- Collectively, this group is known as a normative sample and data from them make up the norms
- Standardization is the process of setting clear procedures for administrating, scoring, and interpreting the test
- The normative sample could also be the standardized sample but not always
- Understanding the normative sample is very important, why?

Sampling

- Simple random sample
- Stratified random sample

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

- Cluster random sample
- Purposive sample
- Convenience sample

Different Norms

- Percentiles
- Developmental Norms
 - Age Norms
 - A 6 year old performs at the level of a 10 year old
 - This is on this material only though!
 - Grade Norms
 - School year typically 10 months in the US
 - A 4th grader is performing at the level of a 5th grader in third month

- This is on this material only though!
- National Norms, nationally representative
 - Anchor norms enable two tests to be compared
 - In USA, students could take SAT or ACT for admission to college

Fixed Reference and Criterion-Related

- Fixed reference group scores are used as the basis for calculation of future administrations of the test
- Raw scores are scaled relative to the performance of the fixed reference group
 - Answering 50 items correctly one year and 50 on the following year doesn't mean you'll have the same score

- SAT does this through using anchor items and equating
- Criterion-referenced, evaluate a score with reference to a set criteria or standard NOT other test takers
- What is the fairest way to score grades in a class room?
